

User Manual

1. First step

1.1 Requirements

Java 17 or higher is required. The game runs on macOS, Linux, and Windows.

All necessary dependencies such as Gson and SQLite JDBC are already included in the “lib” folder.

1.2 Configuration

No setup is required. The game works immediately after download.

Some files are located in the root of the project:

- questions.json contains the trivia questions and can be replaced if you want to use your own questions.
- leaderboard.json and mindwars.db are automatically created the first time the game is launched.

Audio settings and difficulty can be modified directly in the Settings menu inside the game.

1.3 Compilation

To compile the project, open a terminal in the project root folder.

On macOS or Linux, create an output folder and compile all Java files from the src directory into it while including the libraries from the lib folder.

On Windows (PowerShell), create the output folder and compile all Java files in the same way, ensuring the lib folder is included in the classpath.

1.4 Execution

To run the game, execute the Main class using Java.

On macOS and Linux, use the out folder and lib folder in the classpath separated by a colon.

On Windows, use a semicolon instead.

You can add the option “--console” if you want to run the game in console mode instead of the graphical interface.

1.5 Multiplayer (LAN)

To play in multiplayer over a local network, one player must choose “Multiplayer” then “Host” to create a game.

The other player selects “Join” and enters the IP address and port of the host (by default 5555).

Both players must press “Ready” before the game starts.

1.6 Deployment

To run the game on another computer, copy the following folders and files into the same directory:

out, lib, assets, and questions.json.

The target computer must have Java 17 or higher installed. The game can then be launched using the same command as before.

It is also possible to create a runnable JAR file containing the compiled project. Once created, the game can be launched using the JAR file together with the libraries.

2. Connection

When you arrive at the game, a login page appears. The player can either log in with an existing account or create a new one by filling out the requested information.

3.Main Menu

Once logged in, you access the main menu. From this menu, you can start a new game, play in multiplayer, load the last saved game, view player rankings, read the game rules, change settings or quit the game.

In the settings, it is possible to activate or deactivate background music as well as sound effects.

4. New game

When you click on "New Game", several options are offered. The player can choose to play alone against a robot or up to four players on the same computer.

Next, you must select the size of the card, the type of questions and the difficulty. It is also possible to choose a random configuration. The difficulty of the robot can be changed during the game.

5. Multiplayer

Multiplayer mode allows you to play with other players via a network connection.

A player can create a game by choosing the maximum number of players. The game automatically assigns an IP address to the server.

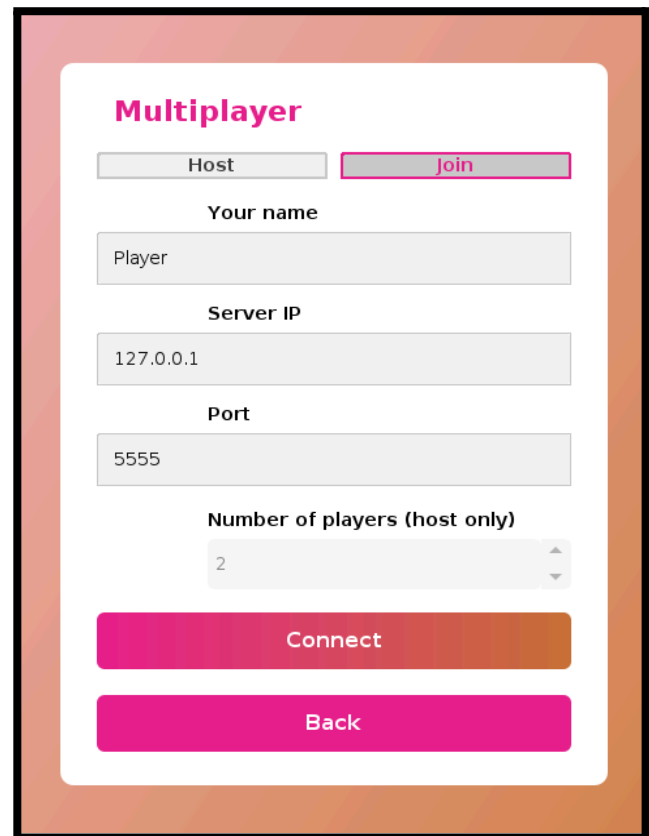

Other players can join the game by entering this IP address in the screen provided.

Host screen

The Host screen is titled "Multiplayer" in pink. It features two buttons at the top: "Host" (highlighted in pink) and "Join" (grey). Below these are input fields for "Your name" (with placeholder "Player"), "Server IP" (with value "172.20.10.6"), "Port" (with value "5555"), and "Number of players (host only)" (a dropdown menu set to "2"). At the bottom, there is a large pink "Start Server" button, a small text instruction "Share this IP with the other player.", and a pink "Back" button.

Join screen

The Join screen is titled "Multiplayer" in pink. It features two buttons at the top: "Host" (grey) and "Join" (highlighted in pink). Below these are input fields for "Your name" (with placeholder "Player"), "Server IP" (with value "127.0.0.1"), "Port" (with value "5555"), and "Number of players (host only)" (a dropdown menu set to "2"). At the bottom, there is a large pink "Connect" button and a pink "Back" button.

To test local multiplayer on a single computer, simply launch several instances of the game and use address 127.0.0.1.

To play on a local network, the player hosting the game must provide their local IP address (for example 192.168.x.x). Other players must enter this address to log in, being on the same network.

6. Flow of the game

6.1 Conquest of the territory

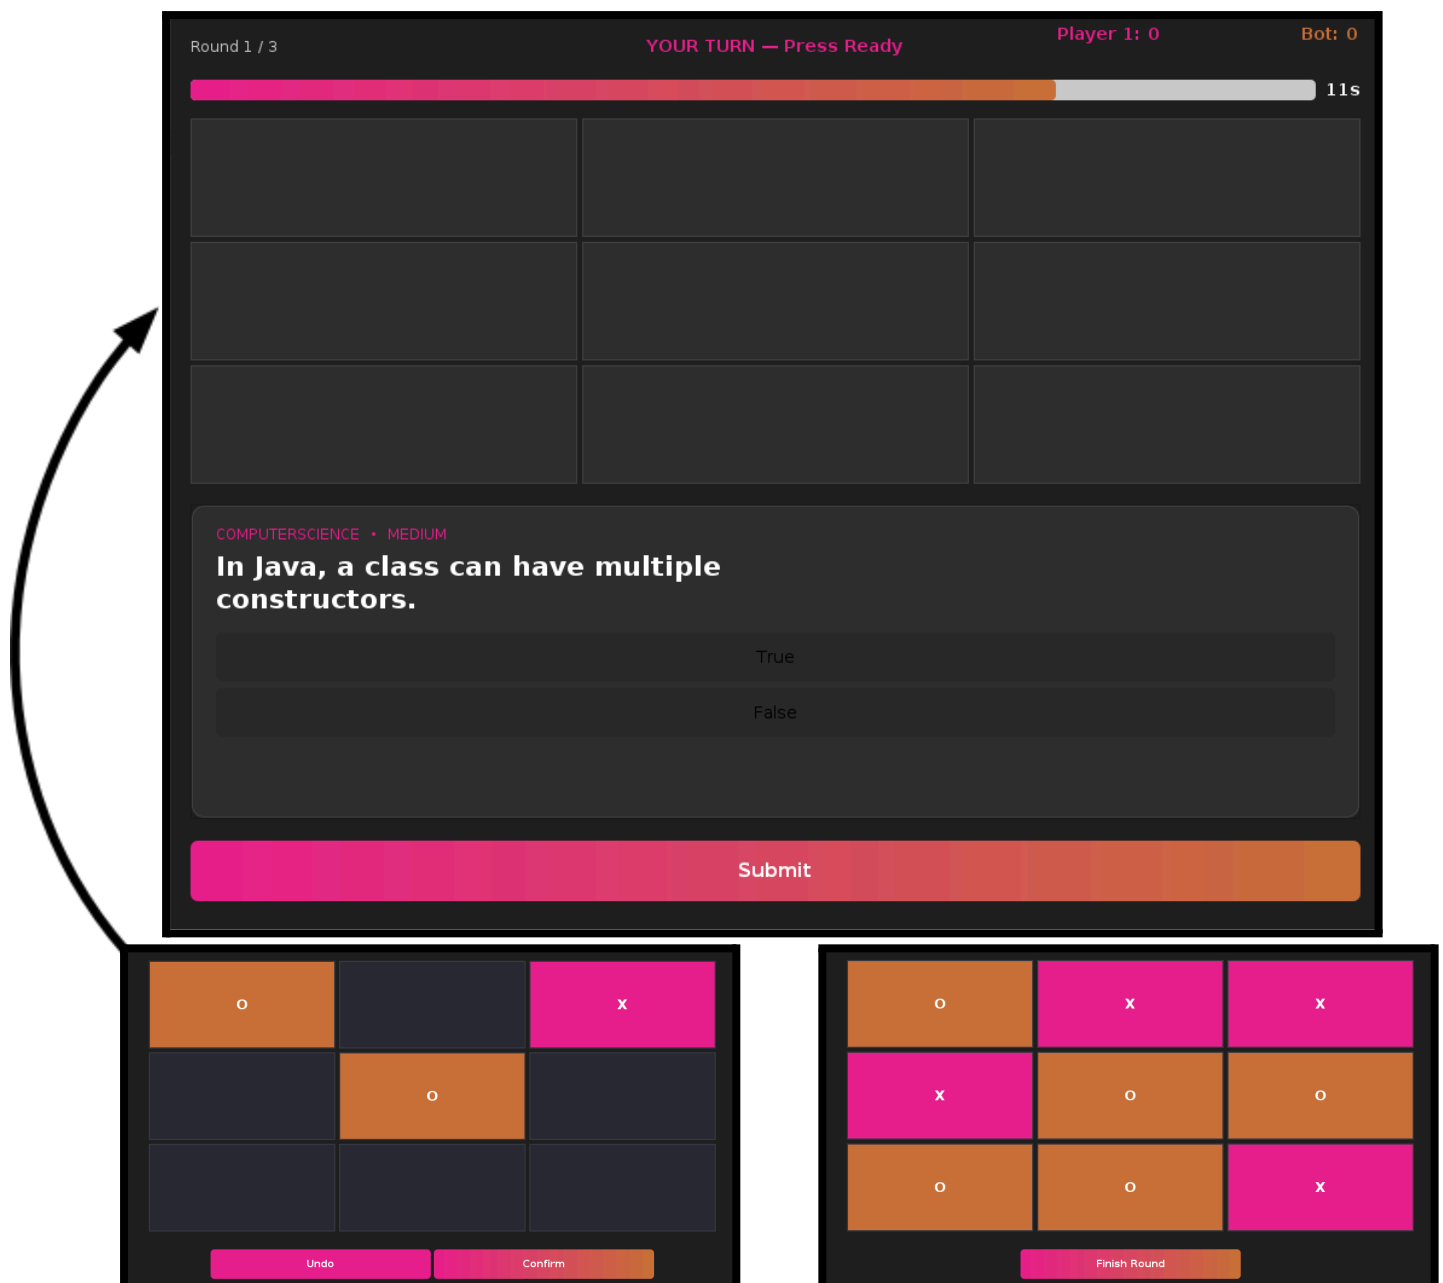

At the beginning of the game, the card is empty. Players must conquer squares by answering questions.

In each round, players are asked a question. They must answer within a limited time (15 seconds).

The outcome of the duel depends on the answers:

- If one player answers correctly and the other doesn't, the correct player wins.
- If both players have the same answer (good or bad), the faster one wins.

The winner of the round can conquer several squares on the map. The loser also recovers a little, but less. This allows both players to progress.

6.2 Point system

Players earn points based on their performance:

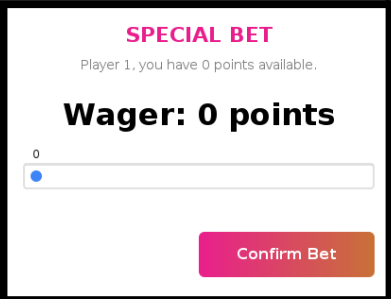

- Easy question: 10 points
- Medium question: 20 points
- Difficult question: 30 points

If a player doesn't respond on time, they lose points.

In the final round, players can choose to bet a portion of their points.

- If the answer is correct, the points wagered are won.
- If it is false, the points are lost.

This system replaces the classic points for this round.

6.3 Special (Numeric) Questions

Sometimes, a question asks you to give an estimate (a number). In this case, both players propose an answer.

The player whose answer is closest to the correct one wins. If the two are tied, the fastest wins.

6.4 End of the game

The game ends after the attack phase or when all end conditions are reached.

The winner is:

- The player with the most points

In case of a tie:

- Whoever has the most boxes wins

If everything is equal:

- The game is declared null

6.5 Final statistics

At the end of the game, a screen displays each player's statistics:

1. Number of correct and incorrect answers
2. Average response time
3. Fastest Response

Players can then choose to replay a game.

Once the game is over, you can play again with the same settings or switch back to the main menu.

Game Over

Player 1 wins!

Player Statistics

Player 1 — 65 pts	
Correct / Wrong	3 / 0
Avg response	4,0s
Fastest response	2,6s
Bot — 0 pts	
Correct / Wrong	0 / 3
Avg response	2,0s
Fastest response	2,0s
